A CHECKLIST OF THE VASCULAR PLANTS IN ABBOTT CREEK RESEARCH NATURAL AREA, OREGON¹

bv

Rod Mitchell, Colorado Women's College, Denver, Colorado

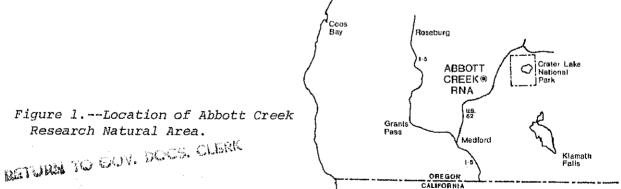

ABSTRACT

This paper is a checklist of 277 vascular plant taxa that have been collected or encountered in Abbott Creek Research Natural Area, Oregon; a brief description of five forested and two nonforested vegetation types is included.

Vascular plants, checklists (vascular plants), Oregon (Abbott Creek Research Natural Area)

INTRODUCTION

Abbott Creek Research Natural Area is located 19 km (12 miles) west of Crater Lake National Park in the Roque River National Forest of southern Oregon (fig. 1). This Research Natural Area was established on November 18, 1946, as representative of the southwestern Oregon, Sierra-type mixed conifer forests and specifically because it contained excellent stands of sugar pine (Pinus lambertiana) (Franklin et al. 1972). The purpose of this note is to document the vascular flora of this Research Natural Area (RNA) to aid future scientific research (Franklin 1970, Moir 1972) and to complement a previous study of forest community composition in the Research Natural Area (Mitchell and Moir 1976).

Research Natural Area.

This work was supported by a contract from the Pacific Northwest Forest and Range Experiment Station and the Pacific Northwest Natural Area Committee.

STUDY AREA

Abbott Creek Research Natural Area is located in Douglas and Jackson Counties, and has a total area of 1 076 ha (2,660 acres). Its western border, defined by the main branch of Abbott Creek, provides the easiest access to major portions of the area. An unmaintained logging road parallels the southwestern boundary. This road is reached from U.S. Highway 26 via Forest Road 3047 (fig. 2). The northern border is defined by a ridge between the Rogue and Umpqua River drainages. The main access to this ridge is via trail remnants from Abbott Butte fire lookout, served by Forest Road 2923. The eastern edge of the area generally follows the Golden Stairs Trail, accessible at its southern end by Forest Road 3017 and by Forest Road 3016 at a more northern point. There are no maintained trails or roads within the RNA.

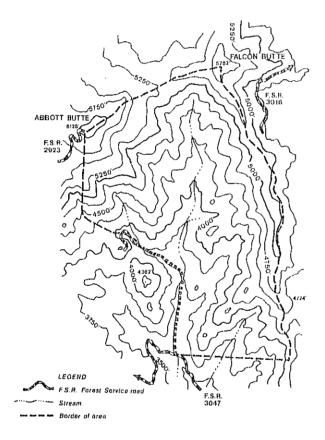

Figure 2.--Features of the Abbott Creek Research Natural Area and vicinity.

Physiography and Geology

The topography is quite steep; much of the area consists of slopes of 25 percent or more. Gentler terrain is found near Abbott Creek and on some high elevation benches south of Abbott Butte and between Abbott and Falcon Buttes. Abbott Butte is the highest point (1 869 m; 6,128 ft) in the Research Natural Area; the lowest point (1 006 m; 3,300 ft) is located in the southwest of the RNA.

The entire area is volcanic in origin. Soils belong to the Freezener-Coyata soil series (Power and Simonson 1969). Typically the soils are acid in reaction and well drained with dark reddish-brown, friable, loam surface layers. Rock fragments range from abundant to less than 30 percent by volume.

Climate

A modified maritime climate characterizes the Research Natural Area. Most of the precipitation results from low pressure systems that move eastward across western Oregon from the Pacific Ocean. During the summers, this dominant climatic feature is modified by high pressure systems that shift fronts northward, resulting in clear, dry weather. This phenomenon results in cool, wet winters and warm, dry summers.

Grazing

The Research Natural Area lies within the Woodruli Cattle and Horse Allotment and presently experiences light grazing on its eastern border. The USDA Forest Service has issued permits in the area since 1923. As early as the 1860's settlers used the area for grazing. It can be speculated that this grazing has affected the present flora, both through the introduction of species not originally found in the area and through a disproportionate amount of foraging on some of the original species.

VEGETATION TYPES

In the forested locations, 119 reconnaissance plots (Franklin et al. 1970) were used to sample vegetation (Mitchell 1972) and develop a classification. These included transects to determine the percentage of ground cover and frequency of understory species (Daubenmire 1968). Five major forest and two nonforested vegetation types have been recognized (Mitchell and Moir 1976). About 80 percent of the Research Natural Area is forested.

- 1. The Abies magnifica vegetation type located at higher elevations in the northwest corner of the RNA is floristically distinct and belongs to the Abies magnifica var. shastensis Zone (Dennis 1959, Whittaker 1960, Franklin and Dyrness 1973). The overstory consists of Abies magnifica, Libocedrus decurrens, Abies concolor, and Tsuga mertensiana. The understory averages over 80-percent cover and is dominated by Adenocaulon bicolor, Bromus vulgaris, Circaea alpina, Erigeron aliceae, Montia sibirica, Osmorhiza chilensis, Trientalis latifolia, Ribes viscosissimum, Rubus parviflorus, Smilacina sessilifolia, Vancouveria hexandra and Vicia americana which occur in over 67 percent of the locations sampled. The ecoclass is CR F9 (Hall 1978).
- 2. The Abies concolor-Tsuga heterophylla/Acer circinatum-Taxus brevifolia vegetation type is on the moist end of the gradient that includes the three other forested vegetation types that are part of the Mixed-Conifer Zone as it occurs in the RNA (Mitchell and Moir 1976). This vegetation type is found at the bottom of the major drainages, usually where there is a permanent streamflow. Pseudotsuga menziesii, Abies concolor, Tsuga heterophylla, Pinus lambertiana, and Pinus monticola comprise the overstory. The shrub layer is very well developed; Acer circinatum, Taxus brevifolia, Castanopsis chrysophylla, Corylus cornuta, and Cornus nuttallii are the most important representatives. The understory is quite dense and is dominated by Achlys triphylla, Berberis nervosa, Chimaphila umbellata, Linnaea borealis, Pachystima myrsinites, Trientalis latifolia, Vaccinium membranaceum, and Whipplea modesta, all of which occurred in over 78 percent of the locations sampled. The ecoclass is CH 32 (Hall 1978).

²Walker, Gorden J., Range Technician, Prospect Ranger Station, Prospect, Oregon; personal communication, 1979.

- 3. The Abies concolor/Idinawa boxestis vegetation type occurs on mesic slopes at lower elevations in the RNA. The overstory consists of recondensia mensicsii, Abies concolor, and Libecedras decurrens. The understory of this vegetation type is very well developed and is dominated by everyween species. The major understory species are Achtys triphytla, Berberis maryona, Chimaphilaumbellata, Coxylus cornuta, Microcium athirlorum, Linnaes berealis, Trientalis latifolia, and Whipplea modesta which occur in over 71 percent of the locations sampled. The ecoclass is CW F3 (Hall 1978).
- 4. The Abies concolox-Pseudotsuga mensionii/Whipplea moderata vegetation type is located on dry midslopes to upper slopes that face south or west. The tree component is dominated by Pseudotsuga mensionii and hibocodrus documents. The understory is poorly developed, often with less than 10-percent total cover. Castanopsis chrysophylla, Amelanchier abultatia, and Garria trementia occasionally provide a shrub layer. Whipplea moderata is about the only understory plant with significant cover values in most locations. Perberis nervosa, Chimaphila umbellata, Hieracium albiflorum, tris chrysophylla, and Trientalis latifolia are found in 75 percent of the locations sampled. The ecoclass is CW S6 (Hall 1978).
- 5. The Pseudotsuga menzicsii-Libocedrus decurrens/Arctostaphytos nevadensis vegetation type is found mainly on south- and west-facing slopes near ridgetops where there are poorly developed slabby lithosols. The overstory is open and dominated by Pseudotsuga menzicsii and Libocedrus decurrens; timus tambertima is also present. The shrub layer is quite well developed and dominated by Arctostaphylos nevadensis, Castanopsis chrysophylla, Ceanothus prostratus, and Garrya fremontii, all of which occur in 63 percent or more of the sample locations. The nonshrub component of the understory is quite sparse and is represented by Arcnaria macrophylla, Chimaphila numbellata, Hieracium albiflorum, Trientalis latifolia, and Whipplea modesta which are present in 81 percent or more of the locations sampled. The ecoclass is CD C3 (Hnll 1978)
- 6. A nonforested community occupies dry, rocky sites at midelevations on the western edge of the RNA. This is a very drought resistant and heterogeneous vegetation type. Most of the species are not found on other sites in the RNA. Brodiaea pulchella, Madia minima, Perideridia bolanderi, and Stipa occidentatis are the only species that occur in over 30 percent of the locations sampled; the total cover never reaches 50 percent. The ecoclass is GB 29 (Hall 1978).
- 7. There are several meadows on the northern edge of the Research Natural Area between Abbott and Falcon Buttes. These meadows continue north of the RNA at higher elevations. Snowpack remains as late as June and is followed by rapid growth of dense herbaceous vegetation. Bromus valgaris, Erigeron aliceae, Heracleum sphondylium, Hydrophyllum Lendleri, Lonicera conjugialis, Melica spectabilis, Osmorhiza occidentalis, Pteridium aquilium, Salix scouleriana, and Veratrum viride are dominant members of this vegetation type. There is evidence that these meadows are being invaded by trees, especially Libocedrus decurrens. The ecoclass is FW 19 (Hall 1978).

CHECKLIST

Methodology

Specimens were collected of all vascular plants found within the Research Natural Area during the summers of 1971, 1972, and 1973. All specimens were verified by F. J. Hermann, Curator of the USDA Forest Service Herbarium,

Fort Collins, Colorado, or by K. L. Chambers, Curator, Oregon State University Herbarium, Corvallis, Oregon. Voucher specimens were deposited in both herbaria.

The checklist of plants is arranged in alphabetical order by family. The nomenclature follows Peck (1961) but in several instances is updated by Hitchcock and Cronquist (1973). The common names follow various authorities, primarily Franklin and Dyrness (1973) and Garrison et al. (1976). Voucher specimens of most species are on file in the USDA Forest Service Herbarium, Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colorado, or the Oregon State University Herbarium, Corvallis, Oregon.

Most species are given abundance ratings by vegetation type. Some species, however, occupy highly specialized habitats and cannot be related to the seven types.

The checklist of the vascular plants indicate vegetation types where taxa are found, voucher specimen numbers, and the herbaria where deposited. The abbreviations for vegetation types are:

- S -- Abies magnifica (Shasta red fir)
- H -- Abies concolor-Tsuga heterophylla/Acer circinatum (western hemlock)
- W --- Abies concolor/Linnaea borealis (white fir)
- D -- Abies concolor-Pseudotsuga menziesii/Whipplea modesta (Douglas-fir)
- | -- Pseudotsuga menziesii-Libocedrus decurrens/Arctostaphylos nevadensis (incense-cedar)
- R -- Drought-resistant, heterogeneous species
- M -- Herbaceous meadow

The abbreviations for abundance scale are:

- A -- Abundant
- C -- Common
- R -- Rare

Abbreviations for the herbaria where voucher specimens are located are:

- 0 -- Oregon State University Herbarium, Corvallis, Oregon
- F -- USDA Forest Service Herbarium, Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colorado.

The mission of the PACIFIC NORTHWEST FOREST AND RANGE EXPERIMENT STATION is to provide the knowledge, technology, and alternatives for present and future protection, management, and use of forest, range, and related environments.

Within this overall mission, the Station conducts and stimulates research to facilitate and to accelerate progress toward the following goals:

- Providing safe and efficient technology for inventory, protection, and use of resources.
- 2. Developing and evaluating alternative methods and levels of resource management.
- Achieving optimum sustained resource productivity consistent with maintaining a high quality forest environment.

The area of research encompasses Oregon, Washington, Alaska, and, in some cases, California, Hawaii, the Western States, and the Nation. Results of the research are made available promptly. Project headquarters are at:

Anchorage, Alaska Fairbanks, Alaska Juneau, Alaska Bend, Oregon Corvallis, Oregon La Grande, Oregon Portland, Oregon Olympia, Washington Seattle, Washington Wenatchee, Washington

Mailing address: Pacific Northwest Forest and Range Experiment Station 809 N.E. 6th Ave. Portland, Oregon 97232
